" We never give in and we always win."

Inside Huntingdon I

The following account is written by two people who both worked in the Beagle Unit inside HLS for over 12 months, leaving in late 2005. The pictures displayed are stills taken from the TV programme 'Animals'. At the end of the film it stated that the scenes of inhalation toxicology on dogs were not shot inside HLS. They were.

We know because these two workers were there when it was being filmed. HLS would not let the TV crew film unless they put this at the end of the programme. In the scene that shows the beagle being killed they had to get workers from elsewhere inside HLS to kill those dogs as the

workers there did not want to be filmed on national TV killing dogs.

"Animal Technician, must be animal lover." the job ad read. "That's me", I thought. I've had animals in my home since I was born. I could never imagine living without them.

I had doubts, believe me. I had listened to talks given by both sides, for and against animal testing. However I'd never really decided how I felt about the subject. 'That was years ago. Maybe things have changed now or even better improved,' I thought. So I rang and asked for an application form. When it arrived I filled it in. All the usual details were asked for, and a small amount of medical history.

A week or so passed and I received a letter inviting me to an interview. Amazingly the letter said the interview could be up to two hours long. I couldn't imagine what they could possibly tell me that would take that long. The interview consisted of seeing four different people, and actually going into an animal unit. I saw animals, and the rooms they were 'dosed' in. I left feeling confused. I still didn't know how I felt about working at a place that was so often slated and hated by so many people. More than anything one specific thing bothered me, that they hadn't told me exactly what my day to day job would entail.

They don't explain anything to you about what you will be doing. When we started we had no idea we'd be cleaning cages or holding dogs while they're put to sleep. Until you get in there on the first day of work, you haven't got a clue what you'll be doing. If I'd known before I went in, I would never have done it.

First day: I was given blue uniforms, wellies and toe-tector shoes. There are a number of inductions that the company gives but not one of these is about working with the animals. Even the health and safety induction was about office work and not anything to do with animals. Most inductions were long and drawn out. I think the people who actually work with the animals should be on a different course to the office workers. There was no mention that at any point you could get bitten by an animal. In the dog building I was met by the NACWO (named animal care and welfare officer). I was told at this point that I would be working every other weekend as overtime. I was astonished to learn that I would be working twelve days on and two off continuously!

Then I met my team leader. She was in the middle of doing a bleed with another member of staff. I was shocked at what I saw and thought it was quite barbaric. The holder was sitting on a stool with the dog to her right hand side also sitting on the chair. She used her right hand to hold the dog's front legs down and keep the dog tight to her body. Her left hand was used to hold the dog's muzzle upwards so that the neck was clearly visible to the technician taking the blood. The dogs were struggling and whimpering as the needle was stabbed and plunged in and out of their necks. I found it very difficult to watch. The trainee technician was trying to reassure the dog but it didn't work at all.

> **"When I went in the next day, one of the dogs was dead in his pen."**

She took me round where my team worked and

I was shown the units where the dogs were, which was building J24. There were nine units my side, each unit holding a maximum of 32 dogs. Some units were empty. There were five full-time staff and one part-timer. I was shown the day books. Everything that happens in a unit each day is recorded in time in the day book, from the first time anyone goes in the unit, right through each procedure to the last thing done in there that day. When the dogs first arrive at HLS they have a number tattooed in their ear. The dog is put into the right pen, then within a few days of being there, the HLS number is tattooed into their other ear. Most dogs hate this and have to be held tight to do it. Some even mess themselves because they are so scared.

Every time I have to get the dogs out for something, I'm just thinking I don't want to do this.They think every time I come out of this cage I'm going to have something done to me, and they are.

We had a meeting with some of the top dog staff one afternoon who showed us some undercover video footage and then we were asked questions about it. There were around 20 staff in the room, some trainees, some licence holders. Not one person answered the questions. Everyone just sat there, silent.

Most of the staff had a very uncaring attitude towards the animals and they seemed to be able to just "switch off" to what was happening.

If you didn't "fit in" with the team you were given all the horrible things to do, more dogs to clean out, more procedures to hold for. You didn't get all your breaks, you were given procedures to 'hold for' at lunchtime so you'd have to have a late lunch. The same people time and time again got away without cleaning out, and never had to miss a break or usual lunch time. They were invited on lunches out and were gone for an hour and a half and sometimes came back smelling of alcohol.

Life Sciences : 2005

Sometimes you'd get a group of people, like 4 or 5 people, holding a dog still for a procedure and it'd always be whimpering. It's bad enough for me to watch and I understand what's going on, they haven't got a clue what's happening... it's really horrible.

I was told that whenever you start something in a unit, before going into the unit, you write your start time in the day book. When you finish you enter the finish time and initial it. Sometimes you were so busy you forgot to put a finish time or anything at all.

At the end of the day the books were all checked by a licence holder and signed. If you had forgotten to write a time you were told to make one up. This is falsifying data and shouldn't be done.

Each morning and afternoon the first and last job to be done was 'writing up' the dogs. This is where you have a sheet with each dog's number on it (before they go on a study or after the study has finished) and you go round the unit checking for abnormal faeces, vomit, under or over active dogs and that they are still alive. You write the time in and initial it.

When the dogs are on a study they are on a computer system, either VMS or Xybion. This is the first job at 8.30am and the final check is at 4.30pm. The dogs are left from 4.30pm til 8.30am without a check. At 6pm the lights went out in the unit (by timer switch) and at 6am the lights came back on.

Cleaning out: after the first write up of the day came the cleaning out. When you enter in the morning the dogs are either in two's or three's. You'd let the pair or three dogs out into the middle of the unit whilst you scraped out, with a spade, the old sawdust and faeces, checked the water valve in each unit, put a shovelful of sawdust in and put each dog back into its right pen. This took ages as you can imagine! The first time I cleaned out 32 dogs it took me an hour and a half.

You do get quicker but on busy days you'd get given half an hour to clean out 32 dogs and of course corners were cut and edges of pens would gradually build up with urine and faeces and sawdust. When you did get enough time it took much longer, or you were made to do a unit which had been neglected for a while and it was horrible.

Sometimes the dirtiness of a unit hit you as soon as you went in, and the dogs were living in it all the time. The units are supposed to be power-hosed every four weeks which meant the dogs being moved to another nearby unit and their unit being powerhosed. This didn't happen every four weeks, sometimes because we were too busy, short-staffed or it was just overlooked. When the unit was eventually powerhosed the pen bars would be thick with faeces and it took hours to clean.

Feeding: All the animals are fed on Harlan Teklad. Whether they are 5-6kg or 12-13kg dogs they are all given 400g daily. If the dogs aren't on a study they get fed as soon as they are cleaned out. If they are on a study they usually get fed an hour after dosing. This can be as late as lunchtime when they are fed. On very rare occasions dogs that have stayed the same weight or lost weight for three or more weeks get 500g of Teklad but that was extremely rare on my team. On some studies the higher dosed dogs go off their food. They were left as long as three days without eating, then they would sometimes get the food moistened. Very, very rarely, were they offered tinned food. The food is left in for two hours then taken away. Any residues are weighed and recorded for each dog.

How the unit is set up for a study: Before the dogs arrive we are given a list of dogs (supplier numbers) and they are sorted into who's going to be in certain groups.

We work to a 'protocol' which tells us how many dogs will be on that study, and what class the study will be. Class '4' is a hazard group and once the study starts everyone that enters that unit has to wear a boiler suit, mask, gloves and over-shoes. If I was caught entering that room without all of these I would be in trouble but I have seen my team leader, vets, study directors and the NACWO all enter the room without any of these on. Then they go into another unit. What are they passing on?

Anyway it depends how many dogs are on that study. One study for example is 32 dogs, 16 male and 16 female. Males one side of the unit, females the other. Starting from the door the first four males and females are what are called "control" dogs. They are not on any drugs but they have to be dosed the same as the others. If the dose is a capsule, they are given an empty capsule, if it's an injection (called sub-cut), injected into the scruff of the neck, it is usually purified water or similar. These dogs have a white card on their pen. Then there was group 2 dogs (yellow pen card). The dose was quite low and apart from the odd one which vomits there aren't usually many signs.

The dose depends on the study. It could be

around 0.5ml to each kg, it could be more. Again it was the next four males & females after the "control" dogs. Then it was group 3 dogs (blue pen cards): same amount of dogs as other groups, this could be 1.5ml per kg or more. It depends on the study as to side effects. Then the last four males & females were in group 4 (pink pen cards). Usually this group's dose was double group 3's. These had the most side effects and could be quite nasty.

One study I was working on was an anti-cancer drug, class 4 hazard, and that had a group 5 section of dogs. Two days after dosing the group 5 dogs and a couple of group 4 dogs

> **"One of the little female dogs had these warts all up her nose and legs... I was told "Oh she's being put down in a few weeks - it doesn't matter."**

Inside Huntingdon I

were very ill. When I got there in the morning there was blood everywhere in these groups. I was shocked, but told to write each dog up as having red-stained faeces. Cleaning this out was not a pleasant job and I was glad I was wearing a face mask.

The team leader called the vets as the dogs were underactive. The vet came in the afternoon and suggested the dogs be given tablets in their water to help them as they were dehydrating. They weren't eating either. The vet suggested something else to help them, I don't know what. We were

never told anything like that. The study director came over and the NACWO came in to see the dogs.

They had a discussion and it was decided that the dogs wouldn't get any medication and they would see how they went over the next couple of days. I said I was unhappy about the decision but I was just a "trainee", what did I know! The dogs, about 5 of them, were lifeless all day, more blood all day, they didn't want to eat, drink or exercise so they were not paired up that night.

When I went in the next day, one of the dogs was dead in his pen. I went beserk and was told to go and get a coffee whilst the team leader, NACWO, vets and study directors sorted everything.

It was decided that another two dogs were to be put to sleep that day. The study was put on hold for a few days, then it was decided that the group 5 was "too high" a dose and the highest they wanted was a group 4. Two more dogs were put to sleep over the next week or so. I was talking to another Team Leader about the study and she said that they knew the group 5 was too high a dose and they knew there would be problems, but they went ahead anyway.

Animals dosed first day: Study starts.
It's always such a busy day when a study starts. Usually two people go in early to clean them out. There is a pre-dose bleed. On a bleed there is a licence holder and a trainee doing a bleed. The blood tubes are all labelled up a couple of days before. Each dog has its own tube and it has on there what time point it is.

> "I saw co-workers grab them by the scruff, shout and swear at them, swing them by the scruff and slap them."

There were always two minute intervals between dogs so the holder would have to go into the unit, get the required dog, which was done as were all controls, all group 2's, group 3's and group 4's. You had exactly two minutes, so once a dog had the needle put in its neck (bleed from jugular vein) you had exactly two minutes for that blood to be taken and then to take that dog back, getting the next dog and that being bled.

Some dogs were not happy to be bled and they would struggle and not sit still. The licence holder would pull them around by the scruff, shout at them, and sometimes even used to pick the dog up off the chair by its scruff and have it dangling whilst they shouted at it. It could be a very disturbing time.

I saw co-workers grab them by the scruff, shout and swear at them, swing them by the scruff and slap them. I was told I was "too close" to my dogs because when I carried them to and from procedures I would hold them tight to me and cuddle and kiss them.

So there was a pre-dose bleed, then at around 9am the dogs would be dosed at two minute intervals. The study directors would come over and they are supposed to check everything was done correctly but they would stand in the way and chat generally between themselves and not take any notice of the study starting. The next bleed would be 15 mins after dose, 2

hours after dose, 8 hours after dose, 12 hours after dose and 24 hours after dose. When the 15 min, 30 min and 1 hour bleeds were being done, there would be at least two teams bleeding, which would be a licence holder and a carrier.

The dogs were in and out of their pens constantly and they would get a bit uncooperative and agitated. The necks would be very bruised and swollen and they would still go in and take the blood. One licence holder I worked with would go in and out about five times with the same needle, not hitting the vein. The amount the same needle could be used was two. I reported this to my team leader but nothing was done.

If we had a naughty dog who wasn't going to sit still it would take longer than the two minute intervals and we'd constantly be running backwards and forwards with the dogs, some of which weigh 12-13kg plus, to make up the time. The time was never changed if it took longer, so again people were falsifying data. We would be expected to do overtime for the

8 and 12 hour bleeds and it wasn't liked if we said no. On busy days like the start of a new study, the animals didn't get any exercise time and weren't paired up until after the 8 hour or 12 hour bleed. They always looked so sad on these days.

Urine cages: Depending on the study, at different times throughout the study the dogs would be put into urine cages. These were very small cages, with hardly enough room for them to turn round. They were on a tray with holes in it so the urine went down the tiny holes, into a hole in the middle of the cage and down into a pot. The dogs were put into the cages at 4pm in the afternoon and taken out of the cages at about 8.40am the next morning.

As the cages were so small, when the dogs had faeces they were treading and lying down in it as they had no choice and couldn't get away from it. Quite a few times dogs got their claws stuck in the holes of the bottom and in the morning their claw would have been pulled out and they had raw toes and couldn't walk on that foot for days. In the morning the pots were all checked for urine. If they had been they were carried back to

Life Sciences : 2005

their pen.

If they hadn't been they had to be catheterised, which was upsetting for the dog. They had been in the cage all night and all the dogs around them had gone back and they'd be barking and pacing. When the dogs were taken out of the cages they would be very smelly and covered in their own faeces, not at all pleasant. When they were in the cages from 4pm to 8.40am they had no water.

Hold for dosing:
As a Trainee Animal Technician I held for all types of procedures, some very invasive and some a little less so. I always felt barbaric after holding dogs against their will. I would hold anything from 20 to 64 dogs. It was exhausting for both me and the dogs. Sometimes while carrying dogs back after dosing I would pass the pens of dogs that had already been dosed and see vomit, body tremors, or a lifeless dog curled up in the corner of its pen. This always broke my heart because normally they would be jumping up and barking with excitement when I entered the room.

Different types of dosing:
The different ways a dose is put into an animal are capsule, sub-cut, oral gavage, infusion, dermal, eye-drops. Capsule was as it says, a capsule which was quite big. It was given to the dog in its single pen, by a licence holder, put to the side of the mouth at the back and pushed down with the thumb. I have found the capsule in the dog's food bowl. I told a licence holder, who threw it in the bin.

I told the team leader after I had got the capsule out of the bin that the capsule wasn't damaged by saliva and could have been given to the dog again. There should have at least been a comment made in the day book that that dog hadn't been dosed that day but nothing. The team leader was going to speak to the licence holder about it, but it wasn't done and no comment was ever made in the day book because I checked.

Another capsule study gave the Group 4 dogs red raw eyes. All the fur around the eyes went and they were so sore. The vets were called and they were given eye drops called viscotears because the eyes weren't making any fluid and they were dry. These drops had to be put in the eyes twice daily. They didn't make the soreness any better. The eyes had thick yellow slime which would crust up and it wasn't until quite a few team members told the team leader how crusty the eyes were that they started to be bathed in the morning before the drops were put in. The third eye-lids were nearly always visible.

Sub-cut: means subcutaneous.
This was an injection done under the skin on the scruff. The scruff had to be shaved weekly and marked into a rectangle divided into two with a permanent marker pen. The injection was done in one side one day, the other side the next day. After the fluid had been injected there would be a lump on their neck. The particular study I had was a painkiller from puffa-fish. As soon as you took the first dog out to be dosed, the group 4 dogs would start salivating very heavily, shaking their heads, and by the time they were dosed their pens would be soaked with saliva and very often they would vomit before dose because they knew what was coming.

> "If you had forgotten to write a time you were told to make one up. This is falsifying data."

After dose, most groups 3 & 4 would vomit and be underactive for up to an hour. The Group 2 dose was actually injected into a colleague by a licence holder, not the whole dose but part of it. This was just washed by a first aider. I had some of the dose squirted into my eye by a licence holder because the dog moved.

Oral gavage
This is done by a plastic tube inserted down the throat and into the stomach. The dose was put down the tube via a funnel and then flushed through with water to make sure all the dose was flushed into the dog. The dogs hated this procedure and often regurgitated the tube. When the tube was taken out the dogs regularly brought up the dose because they would be sick.

Infusion
This was done by a cannula inserted into a vein in the leg. Each day a different foot was used so it would be 4 days before that leg was used again. The fluid was pushed through at a slow rate through a machine. The cannula would have to be taped to the leg and it took a couple of people to hold the dog's leg whilst it went in and one person had to stand with 2 dogs whilst they were being dosed to stop the dogs pulling them out.

Dermal
This was a powder or liquid put onto a shaved part of the dog, usually the back so they couldn't bite or scratch it. It sometimes made the skin raw or red.

Eye-drops
Medicine entering the eye by drops. Given to each dog in its pen. The dogs' eyes in Group 4 became almost shut, red raw, hair loss, third eyelids visible.

The dogs would rub their faces continuously on the floor or pen bars as they were itching, which made their side effects much worse. The eyes became so swollen.

Some things that were very, very wrongly performed:

Incompetence
* I saw blood taken from a dog and put in the wrong blood tube. It was then poured into the right tube without it being washed. A new tube should have been used.

* Untrue readings, licence holder incompetence. Nothing ever noted and no-one else told.

* Some dogs were being put to sleep, and [a worker] had missed taking the blood from one of them. The team leader came running down and took the blood from the dog once it was dead. That blood sample would NOT have been a true blood sample.

* It was a licence holder's job to check the dog's tattoo in the ear before doing any procedure on it. Very often the procedure was done and then the dog's ear would be checked.

* Restraining of animals: Very often a dog did not want to sit beside you on a chair for a procedure. They would struggle and not sit down. As soon as anything went near the dog

Inside Huntingdon I

they would cry and want to get down. Sometimes as many as three people would have to hold one dog, which made the dog more upset. A licence holder would grab the dog by its scruff, sometimes lifting the dog up off the chair, have the dog hanging and really shout at it to behave. Sometimes they would hold the scruff, whilst the dog was sitting on the chair, and push its head and neck down whilst shouting at it.

* During a sub-cut study, the dose would come over from the pharmacy daily. The dose came in brown jars with a label on it for the control, group 2 etc. The amount of liquid was weighed out at pharmacy for how much was needed, plus a little extra. The dose bottles were weighed again when they reached us and the weight recorded.

When the dosing was over, each bottle was weighed again. On a number of occasions the final weight was way under what it should be, meaning that some of the dogs had been given too much dose. This was recorded in the weight sheet and it must have been covered up one way or another because it was never recorded in the day book and the NACWO was never informed. This certainly would have had an effect on the end result data of the study. Once I overheard that the weights weren't right and kept a look out in the day books. I asked the licence holder what would happen. They said they didn't know.

* Needles were repeatedly put into dogs' necks, often more than 5 times before a new needle was used. The dogs get terrible bruising and lumps on their necks but they still continued to have blood taken from the same areas.

There is often a short supply of products like needles, gloves, masks, disinfectants and detergent. When you go to a store room and there is none there you have to search the whole dog building to see if another team can spare some. Disinfectant to clean the floors was in very short supply and we often had to water it down so we could make it last longer. Sometimes there wasn't a team in the whole building that had any. Supplies came in once a week and were ordered by a former team leader who was always telling us just how much each item cost and that we should use things much more sparingly than we did.

* Some dogs that had been there for nearly a year had been on three studies. On one of the studies they all had their thyroid glands taken out by surgery. Then they constantly had to have thyroid tablets. In the end, after being there for so long, they got so bored that they started fighting regularly.

One weekend, a worker wasn't in the unit excercising them, she was outside the unit keeping an eye on them and they started having a really nasty fight. Instead of shouting for help, she just stood there and watched the dogs fight. She then said 'they're having a fight' and we rushed in and tried to separate them. About 6 or 7 dogs were attacking one dog. They had hold of it by its ear, legs, tail and hind leg. The dog was yelping and screaming.

The weekend worker just stood and watched while it took us a long time to get the dogs off. The injured dog was bleeding badly, its ear was almost in two. The injured dog was taken into the annexe. The vet and NACWO were called. They decided that because the dogs were going to be killed next week anyway, they would just euthanase him there and then. A similar fight took place the next day and again the dog was terminated.

I worked in one team where the dosers would race each other to see who could get all the dosing done the quickest, as this was usually done before morning break and the quicker it was done the quicker we could go to break. I'm sure that this is what resulted in the dogs always being given the wrong amount of dosage.

* There was a study that made dogs grow warts. These were put into two units. That end of the annexe was cordoned off, a false wall was put up, dividing the rest of the unit from the end 3, so there was a spare unit for powerhosing. Everything that was put this end was cleaned with Virkon. Every pen, bin,

bowls, toys etc was Virkoned. These dogs had procedures done by a "gun" like instrument which they shot onto six sites on the stomach. These dogs had to be sedated because it was a painful experience. They had four lots of treatment over approx. 6-7 weeks, then the warts started to grow in the dogs' mouths. Some of the warts were enormous. They were measured each week on health check.

> "Sometimes the dirtiness of a unit hit you as soon as you went in."

One of the little female dogs had these warts all up her nose and legs... I was told: "Oh she's being put down in a few weeks - it doesn't matter..."

When the study came to the end, the dogs were put down in the annexe, not taken to the normal place to be put to sleep. This was questioned and the answer given to me was "I'm not answering your questions". I also asked how many dogs were being put in each yellow bin bag, and given the same answer. The dogs were put in yellow bags and wheeled down to necropsy in a large yellow skip-type smallish bin we used to take rubbish out in or go and get small amounts of sawdust and food in. I know for a fact that this wasn't washed first.

The units were cleaned out and then all three units were powerhosed. The dividing wall was taken down. Then the units were used to put dogs in overnight whilst their unit was powerhosed. The two units of dogs that were put into these units developed warts. Not all the dogs got warts but a good 60% of them did.

Life Sciences : 2005

One female dog in particular had warts in her mouth, and on her face, legs and paws. They were big warts. The dog was then given a nasty nickname because of her warts, and a male worker used to call her 'dirty bitch', 'slag' etc. It was then discovered that the warts had come from the "wart study" because:

a) the units hadn't been powerhosed properly,

b) they should have been Virkoned again to kill any remaining germs.The unit wasn't Virkoned again and then another study was put in there for a 13 week study.

When a study came to the end everyone seemed happy that it was ending and that there wouldn't be as much work to do. The dogs were written up and cleaned out as usual. The first dog would usually go around 9-9.30am. They were weighed so they knew how much anaesthetic to use.

If you'd been the one looking after the dogs, they wanted you to take them down. You could say no but it was better for the dog to know the person taking them down because they would be more likely to behave. There was a kill sheet so you knew which order to take the dogs down in. Usually there were two groups of "post-mortem" people, so you'd take one dog, then the next and then there'd be a gap until the next two.

Every study that I took the dogs down on had to have bone marrow taken. When the dog was put to sleep, you'd be sitting on a long work top. The dog would have its front feet on me and back legs and bottom on the side.

The front leg would be shaved. We were shown how to bring the vein up for the needle to be put in. When bone marrow was to be taken, the dog wasn't to be dead when it was taken but nearly there. The dog was laid on its back and the bone marrow taken from the chest bone. This wasn't pleasant to sit through. Two team leaders who I done this procedure with hadn't given the dog enough anaesthetic and it whimpered and moved. This was so upsetting for me. They didn't give more anaesthetic but carried on.

We had to hold the needle in place so they could inject the rest when the bone marrow was done. This didn't happen with many dogs but it shouldn't have happened at all. One particular team leader whom I carried for didn't clean up the blood between dogs and when the next one was taken in they could smell the blood and anaesthetic and it would panic them. I was always told not to cry, they were doing their job, the dogs bred for a purpose and now they'd done their part and they had to go.

On a night out someone from necropsy was boasting about cutting the head open and sawing through the bone to get to the brain and how the smell of blood made them hungry. They admitted that not only one dog was put in a bin bag, odd parts here and there ended up with another dog. Vans came to collect the dogs at night and took them to be burned. it always made me really sad knowing that these dogs went to be incinerated not even as a whole animal...

This is now the 6th time HLS has been exposed and do we really have to ask, how many more times? If you turn the page over you will see a check list of all the Action points for everyone to do. These are all really important.

We have always said that massive animal cruelty is endemic at HLS and that the beagle beating in 1997 was not an isolated incident and now we can finally prove it. What can all of Huntingdon's customers say now? What can Tony Blair and the Home Office say now? Press each and every one of them and do not let them fob you off. We have the evidence.

Please go through the Action points on the next page one by one and do them all. The animals inside HLS are counting on you.

> "The dogs got terrible bruising and lumps on their necks but they still continued to have blood taken from the same areas."

Conclusion

* Blood in wrong dog's tube
* Dogs sworn at for no reason
* Bleeds missed
* Dogs shaken and slapped
* Urines missed
* Dogs poked and prodded with brooms etc for fighting
* Needles not changed after three attempts
* Dogs not adequately anaesthetised before bone marrow removal
* Needles not put in sharps bins
* Dogs not health checked thoroughly
* Not given correct vet treatment
* Restraining of animals using scruff
* Wrongful administration of drug
* Some dogs' treatments missed all day
** Dogs left to suffer with dry/wet abrasions ie impetigo which was passed on to staff's children (fact)
* Senior Technician goes to pub every lunch time and has three pints of Stella, then drives himself and three other workers back
* Same Senior Tech always on drugs, and always late for work. Many people caught this person asleep whilst exercising dogs.
* Dogs pulled along by choker leads
* Inhalation masks done up so tightly that dogs' skin on head was wrinkled
* Number of vets cut from 6 to 3

Action >> HLS customers

Some of the companies below, namely Roche and GSK, have gone on record saying that we have no proof that rough treatment of animals and falsifying of results takes place inside HLS now. They say that what was filmed inside HLS was an isolated incident. No more can they hide behind that and all their excuses have now been blown apart. What excuse can they now have for continuing to work with HLS?

Please take the time to write to each and every customer here urging them to cut all ties with Huntingdon. If they refuse to, then we can conclude that they just don't care about animal cruelty or the falsification of results. If you would like to order copies of the report 'Inside HLS 2005' to send to each customer then please do so.

Also if you can also write to the companies' HQ address abroad as ultimately this is where the decisions are made, then please do as these addresses are the most important of the lot. We have never said this before in the whole of the campaign but we are saying it now. It is your duty to write to these customers urging them to distance themselves from the cruelty at HLS.

The animals inside HLS need you now more than ever. Please do not fail them.

Checklist.
What we need

1 We need you to write to every single customer on these two pages. Don't let them sidetrack you with talk of 'extremism'. The issue at hand here is that things have not changed inside HLS and pages 2-7 contain all the evidence we need. Please also if you can send letters to the companies' HQ if abroad.

2 Support the demos on the back page. If you live near where one of these demos is taking place then please join us. We need numbers. If you can organise your own demos against some of Huntingdon's customers then please do so. Please try and get the press to your demos and make sure that you have adequate copies of the 'Inside HLS 2005' report to give to the press.

You can search for your nearest customers on our new online HLS customer database at http://www.shac.net/HLS/clients.html

3 Money. We rarely ask for money but we are asking for it now. We will be mailing the 'Inside HLS 2005' report to every MP and are printing an initial 5,000 copies of the report. There will also be numerous demos happening not just in the UK but across the world with SHAC UK members in attendance to get the report and its findings across to HLS's customers wherever they be. This is expensive but very, very effective. Wherever a major HLS customer is in the world, be that America to Israel, France to Switzerland, we will be there.

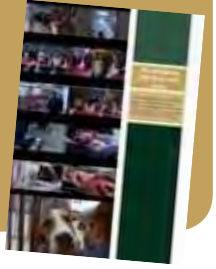

4 Please ring and write to all the suppliers listed. All their previous excuses are now dead in the water. How can they justify supplying a company where workers do this: " I saw co-workers grab the dogs by the scruff, shout and swear at them, swing them by the scruff and slap them. "

5 Please write to your MP and if possible make an appointment to visit him at his local surgery. If you don't know who your local MP is then you can find them at:
http://www.upmystreet.com/commons/l/
All you need to do is put your postcode in.

Again do not let them divert the conversation on to 'extremism' or their views on animal experiments. Keep it to the 'Inside HLS 2005' report where the law has been clearly broken many times. What is your MP going to do about it?

6 Write to the Home Office in the same fashion as you write to your MP keeping it focused on the' Inside HLS' report. If you are not happy with their reply, then write again, keeping it tightly focused on the report. You pay these peoples' wages so if you are not happy with their response then ask again.
Home Office
Direct Communications Unit
2 Marsham Street
London SW1P 4DF

Lastly just work out how many copies of the report you need and order them today.
Good Luck!

Action >> HLS Supplie

Listed on these pages are companies that are all currently dealing with HLS. Please contact them politely and inform them about the report you have just been reading. Thereis no need to be rude to these people: the facts exposed yet again at HLS should be enough for any right-minded person to make an ethical decision to not deal with cruel, incompetent, fraudulent HLS. You are the animals' ambassadors and speak on their behalf, so put your points across firmly and clearly by letter, phone call and email. Remember HLS have lost hundreds of suppliers so if you take the time to speak out for the animals trapped inside their cages at HLS, IT WORKS!

Did you know that HLS has between 2-4,000 Guinea Pigs at any one time for experiments and were one of Newchurch Farm's biggest customers?

1 Mettler-Toledo Ltd

Mettler-Toledo Ltd.,
64 Boston Road,
Beaumont Leys
Leicester, LE4 1AW
Tel: 0116 234 5005
Tel: 0116 235 7070
swiss number is 044 944 4546

Website: http://glo.mt.com/home
For Global sites just use the drop down menu at the top right hand corner of their home page.

They supply HLS with lab equipment and have been doing so for years.

2 Chiller Rental Services

Chiller Rental Services Ltd
Wigan Rd,
Leyland,
Lancashire
PR25 5XW
Phone Warren on 01772 643040
This company have very recently rented chiller units to HLS and say they will not rule out going there again.

3 Vet Way

VET WAY AND DGP
1 Harrier Court, Airfield Bus Park,
Elvington, York YO41 4AU Tel 01904 607 600
Email: sales@dgpgroup.com
Vet Way/DGP have been lying. They made a statement but HLS now send their own vans as Vet Way's courier company won't go there. How stupid Vet Way are to think they wouldn't get caught out....

4 Industrial & Scientific Supplies

10, Trade City,
Ashton Rd, Harold Hill,
Romford,
Essex RM3 8UJ
Tel 01708 383 350
also Notts 07966 188 195

They are supplying building tools to HLS.

37 HRP

HRP
HRP, Unit B6, Manton Centre,
Manton Lane, Bedford MK41
Tel: 01234 272 702

HRP, Rougham Industrial Estate,
Rougham, Bury St Edmunds, Suffolk IP30 9XA
Tel: 01359 270 888
A local firm to HLS passing on equipment to HLS for Eastern Counties, listed below.
Email: bedford@hrpltd.co.uk

SHAC has contacted this firm and the managing director of it said that it is a free country and people can do what they like. Of course it is, and we can carry on informing her staff of just who they are doing business with.

38 Little Creek Kennels

Little Creek Quarantine Kennels
Kingswood Lane, Saughall, Chester CH1 6DE
Tel: 01244 880 267 Mobile: 07850 841 030
Email: enquiries@thelittlecreek.com
This company is a quarantine kennel 45 minutes from Manchester Airport, where numerous lab animals are imported into the UK for torture. It has been leaked to the SHAC campaign that this company has been acting as an agent for HLS lab animal supplier Charles River. Contact this kennels, and get down there and do a demo. The staff may have no idea the owner is heavily involved in the lab animal trade, and nor will the members of the public visiting and collecting their animals.

39 Kirton Tube and Components

Kirton Tube and Components Ltd
Hunt Close, Lowmoor Business Park,
Kirkby-in-Ashfield, Nottingham,
Nottinghamshire NG17 7ER
Tel 01623 750 606

Currently involved in building work at HLS.

40 H.A.C Pipeline Supplies Ltd

H.A.C Pipeline Supplies Ltd
31, Pinfold Rd, Thurmaston, Leicester,
Leicestershire LE4 8AS
Tel: 0116 269 5062

Currently involved in building work at HLS.

41 HEREFORD FAST FREIGHT

Hereford Fast Freight
Unit 4, Twyford Court
Rotherwas Industrial Estate
Hereford, HR2 6JG

This company delivers to HLS on behalf of Arrowmight Biosciences, a lab animal cage supplier and disgusting company.

42 ARROW EXPRESS COURIERS

Arrow Express Couriers

43 Tartan Mechanical Services

Rose Farm Business Park,
Leicester Rd, Countesthorpe,
Leicester, Leicestershire LE8 5QW
Scott Walkinshaw 0116 278 4999

Currently involved in building work at HLS.

44 Tecniplast UK Ltd

Tecniplast UK Ltd
Venture Park
Kettering Venture Park
Kettering
Northamptonshire
NN15 6XR

Tel: 01536 312512
Fax: 01536 312505
Email: info@tecniplastuk.com

Website: www.tecniplastusa.com

This vile company make lab animal cages. They boast that they have been leaders in this field for over 50 years and that they regularly are involved in the design, construction and refurbishment of new and existing animal facilities. All the most evil companies deal with HLS.

Did you know according to the Home Office HLS has 4,000 rabbits for experiments at any one time?

45 Fetch Europe

FETCH EUROPE
Fetch Europe Ltd, 3 Woodhurst Drive, Denham, Bucks UB9 5LL
Tel 01895 835 774 Mobile 07764 584 413
email: info@fetcheurope.co.uk

Fetch Europe are heavily involved in the lab animal transport trade and think it's funny to send emails to the campaign saying how they couldn't care less about driving animals to their deaths and how they really support HLS.

46 Gatwick Expediter Management Services Ltd

Gatwick Expediter Management Services Ltd
101-102A Timberham House, Gatwick Airport,
West sussex RH6 0A6
tel 01293 567 643
fax 01293 568 479

This company carries out customs clearance for Fetch Europe at Gatwick Airport.

47 World Courier

World Courier
Unit 3, Riverside Cargo Centre
Matheson Way, Poyle, Colnbrook
SL3 0HF
01753 726 999
fax 01753 726 981

World Courier also carry out custom clearance for Fetch Europe this time at Heathrow Airport.

And last but by no means least...

48 PDP Couriers

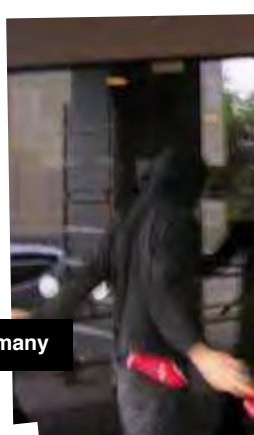

P D P Freight Services Ltd
Unit 10, Ashford Industrial Estate,
Shield Road, Ashford, Middlesex TW15 1AU.
Tel: 01784 420 466 Fax: 01784 424 300
PDP are Huntingdon's main worldwide courier company. They lie constantly. What a sick business.

Actions across the world

Liberations

Italy: A group of 20 activists entered the University of Milano Pharmacology building's animal housing facility (see pictures) at around 6 pm. Within minutes, they were able to remove 8 beagles, 3 golden retrievers, 12 rabbits, and several mice and rats. Students and university staff, including researchers, were present inside the building at the time of the raid. All the animals are now in loving homes. It has been reported that the University has been raided since this.

Russia: The main Russian newspaper has reported that a lab in Russia was recently raided and 15,000 yes 15,000 rats, mice and hamsters were rescued. We know no more than this at present.

UK: The Otter and Owl Centre in Hampshire was visited for a second time by Animal Liberation activists. The pitiful fencing that had been erected after the last visit was removed, and the boar once again given a chance to colonise the New Forest.

Sweden: 9 rabbits were liberated from Per Mattssons meat farm in Berga, Knivsta, north of Stockholm.

USA: 35 hens were liberated from a large battery cage egg facility in Delaware.

Italy: in the northern Italian region of Emilia-Romagna, a group of activists saved three sheep and 14 rabbits from slaughter at a small farm. Also a wild bird that was in a cage was freed in Italy. In the night we entered the organic farm of Borgo Adorno, in Cantalupo (AL). The action has brought freedom to 12 young goats.

Prisoner Support: "If we haven`t got prisoners we have stopped fighting. If our prisoners are forgotten about they have beaten us." Keith Mann

Don Currie is on remand in custody on charges of arson in relation to PDP Couriers who are a major supplier to Huntingdon Life Sciences and have also lied to SHAC in the past, and the Wilton Box Company who make lab animal transportation boxes.

Please write letters of support to Don. If you do not know Don or the other prisoners then don't worry - your letters are still more than welcome and will make a big difference. If you are really not a big writer then just send a card in support. You can also send Don stamps and sae's.

Donald Currie, TN 4593,
HMP Woodhill,
Tattenhoe Street, Milton Keynes,
Bucks, MK4 4DA

Sarah Gisborne was sentenced to six and a half years for conspiracy to cause criminal damage to vehicles and property of HLS supporters. This sentence was reduced to five and a half years on appeal. She is well, fit, strong and determined as always so please write letters of support.

Sarah Gisborne (LT5393),
HMP Cookham Wood
Sir Evelyn Road, Rochester
Kent ME1 3LU, England

Josephine was sentenced to 4 years to do with the now closed Newchurch Guinea Pig farm, who we mustn't forget supplied HLS with many thousands of guinea pigs.

Josephine Mayo (PR6508),
HMP Peterborough,
Saville Road,
Westwood,
Peterborough PE3 7PD

John Smith (TB4887)
HMP Lowdham Grange,
Lowdham,
Nottingham. NG14 7DA.

Jon Ablewhite (TB4885)
HMP Lowdham Grange,
Lowdham,
Nottingham. NG14 7DA.

Kerry Whitburn (TB4886)
HMP Lowdham Grange,
Lowdham,
Nottingham. NG14 7DA.

John, Jon and Kerry are currently serving a 12 year sentence relating to Newchurch Guinea Pig farm.

Heather Nicholson is on remand pending sentencing on the 21st July for the charge of affray in relation to a hunting family. Call us to check what her sentence is before writing to Heather.

Heather Nicholson NR7271
HMP Bronzefield,
Woodthorpe Road,
Ashford, Middlesex TW15 3JZ

A.R. Prisoners abroad

US prisoner Update - Peter Young

Peter Young was recently sentenced to 2 years for raiding 6 fur farms and releasing 8,000 mink. Peter was on the run for 7 years.

If any of these demos are coming to your area, then please join us even if it is for a couple of hours but you need to let us know that you are coming. If you need maps to any of the sites or a list of where we are going on any given day then please contact us. We will have banners, mega-phones and placards so all we need is you, but please feel free to make and bring your own.

JOIN SHAC ON THE UK TOUR!

" The dog was laid on its back and the bone marrow taken from the chest bone. This wasn't pleasant to sit through. The two team leaders I did this procedure with hadn't given the dog enough anaesthetic and the dog whimpered and moved. This was so upsetting for me. They didn't give more anaesthetic but carried on."
